phosphatidylinositol 3-kinase - Chlamydomonas reinhardtii (fragment)

C,Species: Chlamydomonas reinhardtii
C,Date: 11-Jun-1999 #sequence_revision 11-Jun-1999 #text_change 09-Jul-2004
C,Accession: T09084
R,Molendijk, A.J; Irvine, R.F.
Plant Mol. Biol. 37, 53-66, 1998
A,Title: Inositide signalling in Chlamydomonas: Characterization of a phosphatidylinosit A,Reference number: 216411; MUID:98281574; PMID:9620264
A,Accession: T09084
A,Status: preliminary; translated from GB/EMBL/DDBJ

Biochem. Biophys. Res. Commun. 226, 801-809, 1996
Airtle: Members of the MAZ family: A novel colbA clone for MAZ from human pancreatic isl
Airtle: Members of the MAZ family: PMID:96428591; PMID:8831693
Airtle: MANPAR:UPI0000163B39; DDBJ:DBS:085131; NID:91752741; PIDN:BAA12728.1; FA; Cross references: UNIPARC:UPI000163B39; DDBJ:DBS:131; NID:91752741; PIDN:BAA12728.1; FA; Experimental source: pancreatic islet
Cicomment: This protein plays a role in the control of transcriptional initiation of genand between the introns of the mouse gene for immunoglobulin M-D.

Human chromosome 1 international sequencing consortium;

Submitted (WAY-2005) to the EMBL/denBank/DDBJ databases.

-!- FUNCTION: May be involved in transcriptional regulation.

-!- SUBCELLUIAN LOCATION: Nucleus (Potential).

-!- SIMILARITY: Contains 1 BTB (POZ) domain.

-!- SIMILARITY: Contains 2 C2H2-type zinc fingers.
                                                 Length 506;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     a transcriptional activator, depending on the stage of development and spatial restrictions (By similarity). May function redundantly with odd and drm in leg joint formation during the larval stages, acting downstream of Notch activation.
SUBCELLULAR LOCATION: Nucleus (Probable).
TISSUE SPECIFICITY: Has two temporally distinct modes of expression during early embryogenesis; expressed in seven stripes at the blastoderm stage. Also expressed in a non-periodic domain at the anterior of the embryo. During gastrulation, the seven primary stripes are supplemented by seven secondary stripes that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE=22930851; PubMed=14568103; DOI=10.1016/j.mod.2003.08.001; Johansen K.A., Green R.B., Iwaki D.D., Hernandez J.B., Lengyel J.A.; Johansen K.A., Green R.B., Iwaki D.D., Hernandez J.B., Lengyel J.A.; The Externing and morphogenesis."; hindgut patterning and morphogenesis."; Mech.                                                                                                                                                                                                                             Copyrighted by the UniProt Consortium, see http://www.uniprot.org/terms Distributed under the Creative Commons Attribution-NoDerivs License
appear in alternate segments. This results in the labelling of each of the 14 segments in the extended germ band. Expression is relatively weak at the blastoderm stage, gaining in intensity at gastrulation. Expressed in the invaginating stomodeum and proctodeum of the embryonic gut. By stage 13, expressed in the region that will form the proventriculus and in a wide ring at the most posterior portion of the midgut. Expression continues in the gut through the remainder of embryogenesis. Expressed in the proximal Malphighian tubules, brain and pharyngeal muscles during late embryogenesis. Expressed weakly in a segmentally repeated pattern in the leg disk at the distal edge of each presumptive leg segment except in tarsal segments 1 to 4.

SIMILARITY: Contains 5 C2H2-type zinc fingers.
                                                                                                                                                                                                                    Metal-binding; Nuclear procein; Pair-rule protein; Repeat; Repressor;

The present invention describes an isolated MHC class II compound (I) comprising: (a) an MHC class II component comprising at least a portion of an MHC class II alpha chain and at least a portion of an MHC class II beta beta chain, such that the MHC class II alpha chain and MHC class II beta chain form a peptide binding groove; (b) a spaceholder Molecule; and (c) an effector component, where the effector component is linked to the MHC class II component. Also described: (I) a pharmaceutical composition comprising the MHC class II molecule and a carrier; (2) a method of producing an MHC class II compound; (3) a method of directly identifying an antigen-specific T cell; (4) a method of regulating an immune response in a subject; (5) a method of treating an immune disorder in a subject; (7) a method of treating an immune disorder in a subject; (1) has virucide, antibacterial, antiparasitic, cytostatic and immunosuppressive activities, and can be used in gene therapy. The MHC class II compound (I) can be used for preparing a composition for treating immune cativities, and can be used in gene therapy. The MHC class II compound confections, neoplastic disease, autoimmunity or toxicity. The present sequence represents a spaceholder molecule peptide, which can be used in the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes compositions (I) comprising a peptide with an amino acid sequence with tyrosine (Y), lysine (K), and/or valine residues. The complex of the peptide with a major histocompatibility complex (MHC) class II HLA-DR2 protein is involved in modulating an immune response. (I) has antiinflammatory and neuroprotective activities, and can be used as a MHC class II protein inhibitor. The compositions such as multiple sclerosis post-viral encephalomyelitis, a post-vaccine demyelinating condition, and a side effect of administering an anti-tumour necrosis factor agents. The peptide further inhibits proliferation of autoantigen-specific HLA-DR2-restricted T cell clones. ABP52207 to hard.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New compositions comprising synthetic peptides in complex with a major histocompatibility complex class II HLADR2 protein, useful for treating a demyelinating disease, e.g. multiple sclerosis, or post-viral
                                                                                                                                                                                                                                                                                  Human leukocyte antigen; HLA; major histocompatibility complex; MHC; HLA-DR2; MHC class II DR-2 molecule; demyelinating; multiple sclerosis; immune response; antiinflammatory; neuroprotective; proliferation; MHC class II protein inhibitor; demyelinating disease; inhibition; post-viral encephalomyelitis; post-vaccine demyelinating condition;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  having an isolated, prepared epitope selected from any of the sequences from 30 lists given in the specification. Also disclosed is a method for inducing a cytotoxic T cell response against a pre-selected antigen in a patient expressing a specific MHC class I allele by contacting cytotoxic T cells from the patient with the composition cited above. The composition comprises an epitope that is joined by an amino acid linker. The epitope is admixed or joined to a CTL or HTL epitope. The epitope is bound to an HIA molecule on the antigen-presenting cell, where when an A2 restricted cytotoxic lymphocyte (CTL) is present, a receptor of the CTL binds to a complex of the HIA molecule and the epitope. Specifically claimed are peptides having allele-specific binding motifs for HIA. The compositions and methods are useful for preventing, treating or diagnostic agents for evaluating immune responses, for making antibodies and for evaluating efficacy of a vaccine. Sequences given in ADW39251-ADW37745 represent epitopes of the invention as given in Tables 2-31.
                                                                                                                                                                                                                                            Virucide, cytostatic, gene therapy, vaccine, epitope, cytotoxic T cell, MHC class I; CTL, HTL, A2-restricted cytotoxic lymphocyte, HLA; viral disease, cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New composition comprising at least one peptide having allele-specific binding motifs for HLA, useful for preventing, treating or diagnosing viral diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a composition comprising at least one peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 49; DB 7; Length 13;
